

I have an XM radio PCR in my office at work because I get zero radio reception, but have no problem getting the satellite signal. Have the local weather and traffic available through XM satellite allows me to keep my co-workers up-to-date on pending bad weather. Very few of us at the office have internet access - so without that, and without traditional radio signal - satellite is the only option for us.

If radio is concerned with these offerings these should consider improving their own signal and offering instead of trying to squash competition.
